

Setup

Cassiopeia requires Python 3.6 and we highly recommend installing Python with Anaconda, Miniconda, or Mamba.

Install using pip

Simply run `pip install cassiopeia` to get the latest release. (See the [pip](#) install page if you do not have pip installed.) If you want to pull the most recent version, you can install directly from GitHub using `pip install git+https://github.com/meraki-analytics/cassiopeia.git` instead. We may not make a PyPi release (which pip usually pulls from) for small changes to the code.

PyCurl Issues

You may have some issues during installation due to PyCurl. Try the installation first, and if you have issues with pycurl come back and read this section. If Cass installed properly but is throwing certificate errors, skip to the 3rd paragraph.

At the moment PyCurl does not fully support installation with Python 3.6 and many people have had issues. The easiest thing to do (and what we *highly* recommend) is to install Python 3.6 via [Anaconda](#). Anaconda is a package manager for Python and provides many packages that are difficult to install without Anaconda. If you do not or can't use Anaconda, you'll need download and install Curl, then use `easy_install` to install PyCurl and link it to the proper Curl libraries. This isn't much fun, and again we recommend Anaconda to ease the process.

If you successfully installed Cass but it's throwing a certificate error, you probably just need to `pip install certifi`. This should solve any certificate errors.

If you are having more problems, let us know via the Riot API discord server or our Meraki discord server.

Alternative library support

In case PyCurl is not installed, Cassiopeia falls back to [Requests](#), this is a direct dependency and the user is not required to install the library manually.

Furthermore, [ujson](#) is used instead of Python's default [json](#) module when available. To use ujson in conjunction with Requests, the following patch needs to be applied before running any API requests.

```
# see https://github.com/psf/requests/issues/1595#issuecomment-504030697 for more de
import requests
import ujson

requests.models.complexjson = ujson
```

Install from Source

 [latest](#) ▼

If you would like to get Cassiopeia with the most recent updates (even before they have been pushed in an official release), you can clone the repository. Go to [Cassiopeia's Github page](#) and ei-

then download the zip or `git clone https://github.com/meraki-analytics/cassiopeia` into a directory of your choice.

Next, run `pip install -r requirements.txt` in the newly downloaded cassiopeia directory to install the dependencies.

Next, add the newly downloaded cassiopeia source directory to your `PYTHONPATH` environment variable. If a `PYTHONPATH` environment variable does not exist on your system (which may be true if you have a newly installed version of python), you will need to create it.

On Windows, follow the instructions [here](#). Note that if you need multiple paths on your `PYTHONPATH`, you can separate them with a `;`.

On Mac or Linux, add `export PYTHONPATH=$PYTHONPATH:<CASSIOPEIA_PATH>` to the end of your shell rc file (this should be `~/.bashrc` for most), where `<CASSIOPEIA_PATH>` is the path of the directory you cloned, or the `cassiopeia.zip` file you downloaded.

Restart your terminal/IDE.

Google can probably give you more information as well, and note that the path name you add your `PYTHONPATH` should end in `.../cassiopeia`.

Setting Your API Key and Other Settings

By default, Cass pulls your API key from an environment variable called `RIOT_API_KEY`. You can modify this behavior by calling `cass.set_riot_api_key(...)` or by creating a your own configuration for Cass (see [Settings](#) for more info). However, we encourage new users to use Cass's default configuration.

To create an environment variable on Windows, follow the directions [here](#). On Linux or Mac, add `export RIOT_API_KEY='<YOUR_API_KEY>'` to the end of your shell rc file (this should be `~/.bashrc` for most), where `<YOUR_API_KEY>` is your Riot-issued API key. Then restart your terminal/IDE.

Plugins

Cass has plugins that enable additional functionality. See [plugins](#) for more information about how to install each plugin.
