

Basic attack

A **basic attack** (also called a **standard**, **normal**, or **auto attack**) is the default means by which a unit deals damage. The player orders their champion to perform a basic attack when they **right-click** on an enemy, or when the "attack-move" command is used (default **A**); idle champions may also automatically chase and attack targets that venture too close to them, if the option to "auto-attack" is enabled.

Turrets, minions, and most monsters perform basic attacks as their only method of dealing damage.

A **basic attack** under normal circumstances deals  100% AD **physical damage**. A unit's **attack timer** determines the time it takes to fire a **basic attack** and wait for a new one to be available; it is reduced by attack speed and reset by basic attack resets.

Acquisition

In order for an attacker to initiate an attack, they must first **acquire** a target. Acquisition occurs when an attacker is ordered to attack a valid target, as a result of an attack command, automatic target acquisition, or the forced action effects  taunt or  berserk. The attacker will attempt to attack the unit if it is within their  attack range, or attempt to move toward it until their attack range meets its  gameplay radius, and then stop moving and attempt to attack the target. Acquisition of the target will continue until the attacker is given a new target, attacking is canceled by any means, or the target becomes

invalid.

Auto-attacking

By default, when champions are idle they automatically acquire the nearest enemy unit within their  acquisition range as their target. This feature is called *automatic target acquisition* or simply *auto-attacking* and can be toggled from the [Settings](#) > 'Game' tab.

Auto-attacking can be temporarily disabled by holding down the "hold position" key (default **J**), or by issuing a stop command (default **S**), which stops all orders including auto-attacking until a new order is manually provided by the player.

Attack-move

Attack-move commands allow a champion to move toward a given destination location while scanning for a valid hostile within  acquisition range. Attack-move has two modes:

When using regular attack-move (default **A**), the player's  attack range indicator becomes visible and they may select either a location or a target by left-clicking. Selecting a location scans to acquire the nearest target to the *champion's position*. Selecting a target directly acquires it without scanning, like a normal attack order.

When using attack-move click (default **SHIFT + RIGHT CLICK**), the champion performs the above, but without the player having to select separately. The position of the player's cursor when issuing the command is assumed to be the selection position. The range indicator is not visible when using attack-move click.

The "Attack move on cursor" option changes the targeting behavior of attack-move commands. It can be toggled from the [Settings](#) > 'Game' tab.

If this option is enabled: the champion may also scan to acquire the nearest target in a circle around the *cursor's position* within or near attack range.

If this option is disabled, or a target cannot be found using the cursor's position within or near attack range: attack-move commands use the default behavior of the *champion's position*.

[Others](#)

[Trivia](#)

[References](#)

General

A basic attack cannot be avoided under normal circumstances once the attacker has begun their attack; it also cannot lose its target and it may hit them despite any subsequent changes in position. The following are exceptions to this rule and will cause basic attacks to fail:

Parrying effects, which negate the attack's effects entirely:

 Dodge

 Block

 Blind

Attacking becomes disabled, rendering basic attacks unable to be declared. This includes (this lists those that have the capability to do so):

 Crowd control (e.g.  disarm,  stun,  suppression)

 Channeling

 Lockout

Cast time

The attack's windup is interrupted, if the:

Attacker is issued a different command

Attacker or the target  dies

Target becomes  untargetable

Target is too far away

Target is no longer in  sight

Certain basic attacks can be physically dodged (by using mobility spells or quickly moving out of the way) as they do not follow their target after being fired, though they travel fast enough that they are unlikely to be dodged. These are:  Graves'  New Destiny and  Twitch's  Spray and Pray.

Champion

When a champion is ordered to attack a valid target and acquisition of them continues without interruption (meaning the champion is left to continue attacking the same, valid target on their own), delays may emerge. These delays are caused by potential target checks. The champion may also not perfectly stop to attack the target *at* attack range, but may finish their movement at a slightly closer distance before attacking.

Due to this behavior, manual cycling of issued movement and attack commands is faster and more precise than automatic orders.

Many champions have abilities that will affect their basic attacks in some way or form. Such abilities are treated like basic attacks, which means they may

trigger on-hit effects and/or ability effects.

There exists a two-game-tick (0.066 second) grace period where a champion's attack windup becomes *inherently* uncancellable by the player through movement commands and/or the hold or stop commands. This is a strictly unchanging implementation: at incredibly high attack speeds, it may cause any given attack windup to be uncancellable for its entirety, since it would last less than or equal to this grace period of 2 game-ticks.

Minions

Main article: Minion

Minions will automatically attack their closest target by default, but may change targets in a similar manner to turrets.

Monsters

The majority of monsters only use basic attacks that deal physical damage, the exceptions are:

Baron Nashor who also casts abilities.

Rift Herald who also casts abilities.

Gromp whose basic attacks deal magic damage.

Rift Scuttler which does not attack at all.

Turrets

Main article: Turret

Turrets have **armor penetration**, and when hitting a  champion, they additionally deal more damage to any champion  for each consecutive attack, up to a cap.

The behavior of turrets as well as their basic attacks' damage are described on the corresponding page.

The only exception to the above is the Nexus Obelisk (also called the *Fountain Laser*) that deals  a special type of true damage which ignores all kinds of damage reduction, untargetability and damage immunity effects and its attack does not have a missile travel speed.

Structures

Structures can normally only be damaged by basic attacks. However, some abilities that function like basic attacks (e.g.  Fiora's  Lunge,  Trundle's  Chomp,  Senna's  Piercing Darkness, etc.) and certain effects such as  Tristana's  Explosive Charge and  Ziggs'  Satchel

Charge are special-cased to be able to target and deal damage to turrets.

Vision

Basic attacking while hiding in brush or in Fog of War will reveal a 300-unit radius centered at them for 2 seconds after the attack completes.

Damage

Basic attacks always deal physical damage, with some exceptions.

The following will modify the attack's total damage to magic damage:

 Galio's  Colossal Smash
 Nidalee's  Takedown
 Sylas'  Petrificate Burst
 Twisted Fate's  Pick a

Card

 Viktor's  Discharge
 Zac's  Stretching Strikes
 Zeri's  Living Battery

Finally,  Yone's  Way of the Hunter can modify the attack's total damage to part physical and part magic damage, and  Camille's  Empowered Precision Protocol will modify the attack's total damage to part physical and part true damage.

Barring the exceptions above, certain items, buffs, and abilities may cause the attacker to deal additional damage of any subtype on top of their base physical damage. The physical damage dealt by basic attacks benefits from the attacker's  attack damage stat and is reduced by the target's  armor.

When basic attacking a turret,  champion attacks deal **100% base AD (+ 100% bonus AD) (+ 60% AP)**:

Physical damage, if **100% bonus AD > 60% AP**

Magic damage, if **100% bonus AD < 60% AP**

Attack speed

Main article: Attack speed

See also: List of champions/Basic attacks

The rate at which a champion attacks is called  attack speed and is by default capped at 2.5 attacks per second, though certain abilities and runes can modify this value.

Attack timer

Attack timer = 1 ÷ total attack speed

Like abilities, basic attacks have an uptime when a basic attack is available, and a downtime when the basic attack is on-cooldown.

Attacks follow a two-phase period called the **attack timer**, which consists of:

1. The **windup**, during which an attacker executes a basic attack.
2. The **cooldown**, during which an attacker cannot execute a basic attack.

Starting a windup also starts counting the attack timer.

When the windup is interrupted by any means, the attack timer stops counting and resets to zero. A basic attack has **not** been launched and a new windup may begin whenever allowed/possible.

When the windup completes and a basic attack has been launched, the attack timer continues on to incur its cooldown phase. All issued attack commands will be invalidated during this time.

When the cooldown completes, the attack timer also ends, allowing a new windup to begin.

Optimizing movement commands after launching an attack is known as **stutter-stepping**.

Windup

A unit's **attack windup** is the portion of their attack which must be completed in order to launch it, different for each unit. The attacker must be standing in place in order to complete the windup.

Upon the windup completing for non-projectile attacks, the attack simultaneously launches and hits the target.

Upon the windup completing for projectile attacks, launching the attack creates a projectile, which follows and hits the target shortly after.

The windup and therefore the attack is canceled by issuing a different command at any point before the moment of launching. After launching the attack, commands may be freely input without penalty.

Normally, a champion's **windup time** scales the same as their attack's total time, proportionally to their attack speed given both bonuses and  cripples. For champions that are given a **windup modifier** (a value different from the default **1**) by the game rules, the actual duration of their windup is scaled against the expected value by that amount. *Base* windup time refers to the champion's windup time at level 1 and with no attack speed bonuses.

All champions are implicitly given a **windup percent** by the game rules, the percentage of the attack's total time that the windup takes up. There are currently two different ways of determining the windup percent — most newer champions use an independent formula while all others utilize a constant. *This difference does not affect gameplay.*

The original way of calculating the windup percent is $0.3 + \text{attackOffset}$ where:

attackOffset is a given positive or negative decimal value.

The updated way of calculating the windup percent is $\text{attackCastTime} \div \text{attackTotalTime}$ where:

attackCastTime is a given positive decimal value in seconds

attackTotalTime is a given positive decimal value in seconds, larger than attackCastTime

Assuming:

All attack speed values are in decimal form.

WindupPercent = the statistic as a decimal

WindupModifier = the statistic as a decimal, defaults to 1

currentAttackTotalTime = $1 \div \text{total attack speed}$

baseWindupTime = $\text{WindupPercent} \div \text{base attack speed}$

Then to calculate a champion's **current windup time**, use the following formulas:

1. General form:

$$\text{baseWindupTime} + \text{WindupModifier} \times \{ \text{currentAttackTotalTime} \times \text{WindupPercent} - \text{baseWindupTime} \}$$

2. If the champion's **base** attack speed and attack speed **ratio** are equal, the formula can be adjusted to:

$$\text{currentAttackTotalTime} \times \text{WindupPercent} \times \{ 1 + \text{bonus attack speed} \times (1 - \text{WindupModifier}) \}$$

3. If the champion has no **windup modifier** and their **base** attack speed and attack speed **ratio** are equal, the formula can be simplified to:

$$\text{currentAttackTotalTime} \times \text{WindupPercent}$$

or

$$\text{baseWindupTime} \div \{ \text{bonus attack speed} + 1 \}$$

Resets

The cast of certain abilities and item actives will **(forcibly) reset** the attack timer to zero. Depending on which phase of the attack the player casts them in, this effect may be detrimental or beneficial to the player:

Resetting during the windup means that the current attack is canceled, thus delaying the windup and launch of the next attack.

Resetting during the cooldown means that the remaining cooldown is negated, thus allowing a new windup to begin faster than normal.

 Hail of Blades does not consume a stack from launched attacks that have been reset.

The following abilities will reset the basic attack timer after use:

 Aatrox's Umbral Dash
 Ashe's Ranger's Focus
 Blitzcrank's Power Fist
 Briar's Head Rush, Blood Frenzy, and Snack Attack
 Camille's Precision Protocol
 Cho'Gath's Vorpall Spikes

The following [item actives](#) will reset the basic attack timer after use:

[Titanic Hydra's Titanic Crescent](#)

Special Cases

[Bel'Veth's](#) [Void Surge](#), [Kai'Sa's](#) [Killer Instinct](#), [K'Sante's](#) [Ntofo Strikes](#), [Gwen's](#) [Skip 'n Slash](#), [Rell's](#) [Ferromancy](#): [Mount Up](#), [Riven's](#) [Broken Wings](#), [Skarner's](#) [Shattered Earth](#), and [Hextech Rocketbelt](#) * are attack resets that aren't considered one for [Hail of Blades](#).

[Leona's](#) [Shield of Daybreak](#) and [Volibear's](#) [Thundering Smash](#) are attack resets that don't put the user's basic attack timer on cooldown when using their spell's attacks, resulting in a double attack reset.

Certain abilities that reset the attack timer will cause the caster to dash before they are able to declare a basic attack again, meaning they will not be

able to follow up with their next basic attack as quickly due to the time spent performing the dash. In order to bypass this lockout time, the caster can try to end the dash prematurely, such as dashing into a wall or dashing in place (if applicable). This is the case as the caster spends less time dashing and decreases the amount of time it takes to execute their next attack.

Uncancellable Windup

A basic attack that is not  interruptible is classified as having an  uncancellable windup. Basic attacks with uncancellable windups are only stopped by  death,  polymorph,  Quinn's  Vault, and in some cases,  untargetability and range. These include:

 Ambessa's  Drakehound's Step

 Aphelios'  Severum

 Blitzcrank's  Power Fist

 Briar's  Snack Attack

 Caitlyn's  Headshot

 Camille's  Precision Protocol

 Darius'  Crippling Strike

 Dr. Mundo's  Blunt Force Trauma

 Fizz's  Seastone Trident

 Galio's  Colossal Smash

 Garen's  Decisive Strike

 Gragas'  Drunken Rage

 Illaoi's  Harsh Lesson
(only within her base
 attack range)

Trivia

Each unit that can perform basic attacks has a unique firing and recovery animation for their attack's windup and winddown which represents the physical action of drawing into and away from an attack.

A champion's basic attack animation may be modified by [skins](#).

[Turrets](#) only display their acquired target and the fired attack, for game clarity purposes (also, turrets are thematically stationary).

Hostile turrets are the only units in the game that visually and

unambiguously mark an acquired target, specifically with a line from their apex to their target.

In the initial iteration, the icon used to denote basic attacks is reused from an alpha item with unknown effects called  Long Staff.

"Basic" comes from the fact that "attack" used to refer to any hostile action a champion could perform, with "special attacks" referring to ability-based actions. Effects such as  Unbreakable used to refer to "attacks" in their in-game tooltips, referring to what we would now distinguish as basic attacks and abilities. The use of "attack" to refer to anything other than "basic attacks" has generally been discontinued, but affixing the term with 'basic' remains.

The majority of champions' **windup time** makes up around 15–30% of their attack's **total time**.
